

## Android Test Application

You should implement one screen with a list of currencies. Link to designs in figma:  
<https://www.figma.com/file/cUsxw4zNAvU47ADDCJemBM/Rates>

The app must download and update rates every 1 second using API  
<https://hiring.revolut.codes/api/android/latest?base=EUR>

List all currencies you get from the endpoint (one per row). Each row has an input where you can enter any amount of money. When you tap on a currency row it should slide to the top and its input becomes the first responder. When you're changing the amount the app must simultaneously update the corresponding value for other currencies.

Use any libraries and languages(java/kotlin) you want. Please, note that the solution should be **production ready**.

Video demo: <https://youtu.be/omcS-6LeKoo>

Unfortunately, we do not provide the full list of full currency names and icons, but you are welcome to use flags from the Internet or emojis instead.

**Please upload your app to github/bitbucket/etc. and make sure to provide public access after you share the link with us for review.**

Good luck!
